Who are scideas ?

scideas software are not graphic designers who have turned their hand to web design. We have commercial software development experience with expertise in UNIX systems (the technological base of the internet), SQL databases and both client-side and server-side scripting.

Why choose scideas for your web site ?

scideas has the technological know-how to deliver anything from a simple static web site using modern CSS coding to a bespoke php/SQL web application developed to provide exactly the functionality that your business requires. And with our programming skills you know that we will be able to fix any problems or make any enhancements that your site might require in the future.

scideas CMS

scideas offers bespoke **Content Management Systems**. Unlike most web designers we do not use a template system, resulting in your site looking similar to thousands of others. We give you the power to update and edit data on your site whilst retaining full freedom of design.

Types of Web Site

There are **two types of web site**.

A **static site** displays fixed information and always looks the same to each visitor. These are cheapest to develop and are essentially online advertisements for your business. A static site is like a magazine article.

A **Dynamic Site** has pages which are created on the fly using code such as javascript or php. Information for the pages may come from a database. These sites allow interaction by the user and are often known as **web applications**. Because these sites require programming expertise they are more expensive than static sites. Content Management Systems, online shops and forums are examples of web applications.

Web Site Charges

As well as the initial cost of developing your site there are recurring, annual charges for:

- ♦domain name registration
- ♦hosting

You will also need to provide for future changes. This can be by

- ♦annual maintenance charge
- ♦ad hoc payments
- ♦Content Management System
